The majority of people who use the internet have no actual idea about what it really is, where it has come from or even what really makes it work. If they were given a quiz about the way the internet functions they would fail. This is the majority of users simply because most people are still learning their way around, this leaves a rather small percentage of the internet users being people who are considered a bit computer savvy. Those who are a bit computer savvy tend to realize that even web pages and websites are all software that is carefully coded to allow numerous people to access them at a single time. However, for those who are unaware of exactly the purposes of social network community software it can seem a bit strange and even thoroughly overwhelming. Yet, with a bit of time and effort placed upon learning what you are doing, it is possible to move along and work towards finding a suitable solution that will put you firmly in

control of how things work in your benefit. It is very important to understand social network community software so that you can understand what you can and what you cannot do online. The majority of people who are aware of websites such as MySpace and Facebook realize that they were created with the purpose of allowing people to stay in contact. There are numerous other websites that are highly similar, however these two sites are amongst the biggest and most popular that are around. Finding other sites is always possible, however the user base tends to be much smaller and the number of people you can meet and connect with is decreased as well. If you are looking for a site that can give you numerous tools and solutions to help you stay in contact it is very important to look at places that are able to provide numerous methods of support, including tutorials. Social networking community software has changed in recent years and the changes are quite good. With the software changed to add more security features, greater ease of use and even the possibility of blogging right from a profile page the average user who has no experience online can generally still use the social networking community software without feeling overwhelmed or even left out. After all, MySpace is one of the most popular places to connect regardless of age. This means that children and even older adults alike are all able to interact together; the ultimate result is that people are able to use the software to help them learn how to successfully navigate the internet much better. However, what happens if the software fails for some reason? Those who are computer savvy all understand and realize that it cannot work 100% of the time. There are bugs, kinks and other problems that must be worked out, and trying to find the solution to these problems is not always easy. However, research teams are generally assigned the task of correcting problems rather quickly. Yet without the social networking community software there is simply no way to communicate with the other people on the site. The software itself is the main driving force behind the website itself. The choice of programming language can vary greatly depending upon which site you are visiting. There are sites that are created in java, others in PHP, a few are in standard HTML and still others use some of the more advanced programming languages. The ultimate choice of programming language has little to do with affecting the way the user actually uses the site but more with how the site actually runs behind the scenes. Regardless of which programming language is used, without the social networking community software installed, created and fully functional the social networking websites that everyone has come to know and love simply would not exist. Ensuring that the sites stay up is not something that individual users can handle, but being aware that they do on occasion go down is important. Many new computer users become very confused when a website is down, this is often because they do not realize it is actually software that is installed on a web server and accessed using an internet browser. However, just as typical software has problems and complications the web based social network community software has problems as well. The good news is that typically, the problems are very small and the sites are still one of the best places for people to start learning the internet.
