## **Sample of Content:**

The primary purpose of social networking is to help people connect no matter if they are across the room, or across the world. Using the tools and features that social networking can provide it is possible to expand your options and really generate friends that you would normally never know or ever speak to.

## **Content:**

The primary purpose of social networking is to help people connect no matter if they are across the room, or across the world. Using the tools and features that social networking can provide it is possible to expand your options and really generate friends that you would normally never know or ever speak to. The idea of meeting new people who are all around the world may seem highly interesting, yet until you are actually meeting these people you never realize just how amazing it can really be. Those who are interested in social networking learn quite quickly that the best software for social networking will include certain features to help them maximize their time effectively. One of the biggest tools that people like to use is the ability to send messages to other users without giving out personal information. In a world where SPAM is often flooding e-mail boxes on an hourly basis this can be one of the biggest advantages that

software for social networking provides. The ability to have SPAM filtering tools included as well also means that there are far fewer problems with members spamming your message box as well. While there are numerous businesses that use software for social networking purposes the vast majority of individual users simply do not want to be spammed. Being able to block these messages means you have increased your privacy. Other abilities that social networking provides is the ability to block users from contacting you, this can be especially helpful for young children and even people who only want to be contacted by people that they already know. The vast array of people that you can find on the internet makes it very difficult at times to really know who is your friend and who is not, having the ability to block people that you do not want contact with. This may seem trivial, but many people especially young children and women do not want to be bothered by everyone who comes across their social network page. Other key features that are in high demand in software for social networking includes the ability to easily share pictures and video. While there are sites devoted to the process of sharing video alone, such as YouTube, the vast majority of people do not want to hop around to various websites in an effort to see everything that has been posted by their friends and family. This can take additional time and really work to drive someone absolutely crazy. Typically, the ability to share pictures and video right from the social networking site that handles everything else is the most common choice. MySpace is a classic example, they allow users to share videos and pictures quite easily from their profile page, and also recently implemented a feature allowing people on a users friends list to see what updates have been recently made. The additional features that tend to be nice are the ability to scan through your friends friends. These are the people who are friends of your friends, and sometimes you can locate your own friends this way. Speaking in terms of personal experience, you can often find the bulk majority of your friends this way, rather than trying to search based upon names, or even e-mail addresses. This can really speed up the process of trying to track down friends and family that you are unsure of how to contact, plus it allows you to add someone that you might have otherwise accidentally forgotten to add yourself. Sites like MySpace have also added some features to their software for social networking including MySpace Messenger. This is an instant messenger program that pulls contacts straight from your Friends List allowing you to have a real time live chat with anyone that you choose who also has the program. This can be quite helpful, and again keeps your personal information personal for those that you do not want to share it with. For example, not everyone is comfortable handing out personal e-mail or instant messenger screen names. This is actually quite common, so being able to use a built in instant messenger function is quite helpful. As the software for social networking becomes much more advanced, the uses for it advances and grows as well. New parents proudly display baby pictures, people look around for love and still others use the programs to connect with new friends and even stay in touch with everyone in a single place. Your use for software for social networking may be vastly different from someone else, but overall there are plenty of ways that it can benefit you.
